User registration

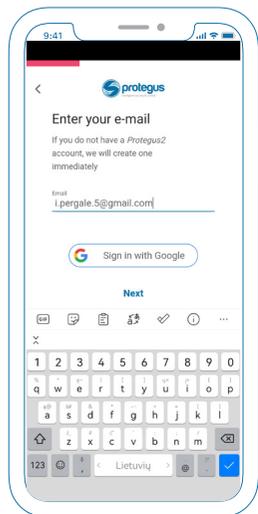

You can sign in with Google account or register with email.

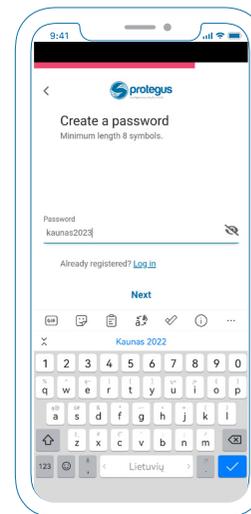

At the entered email address you should get an email with 3 digit code. Enter those digits to confirm the email address. And press next.

If you do not receive a letter check the spam or press [Resend email](#).

Enter your existing email and press next.

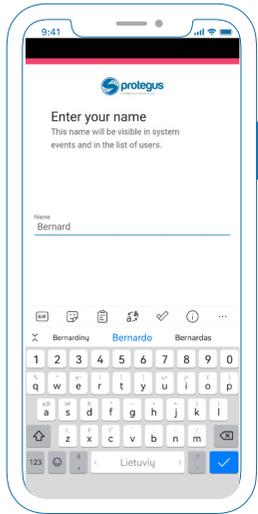

Create a unique password for Protegun 2 account.

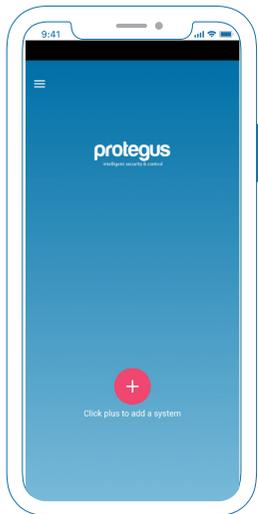

User registration

4

Enter the name by which you will be recognized by other users of the system.

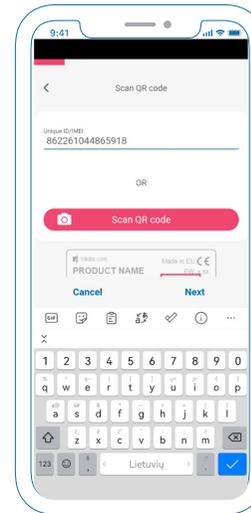

Registration is complete. After that, you will be transferred to the initial protegeus 2 screen.

Add system

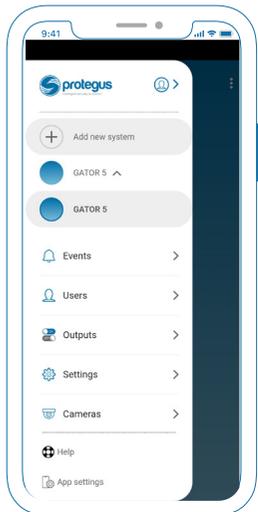

To add a system, press the red plus button in the initial screen.

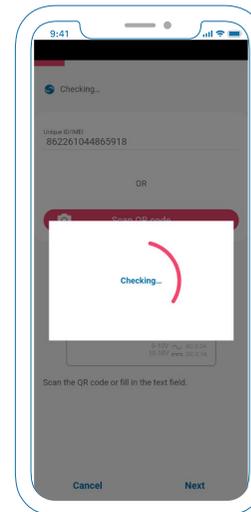

You need to enter module IMEI or scan QR code.

You can find QR con on the pack-
age or module back.

Or if you already have a system, open the sonini menu and select "[Add new system](#)".

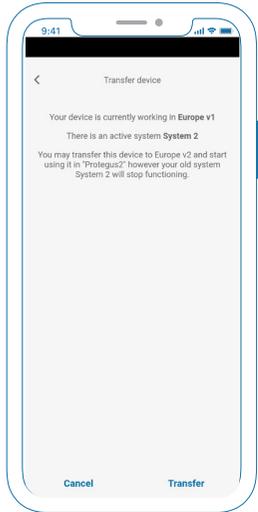

Now you need to wait while the
modle will be added to the
Protegeus 2 server.

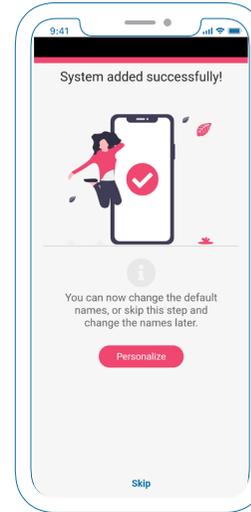

! Module must be connected to the internet.

Add system

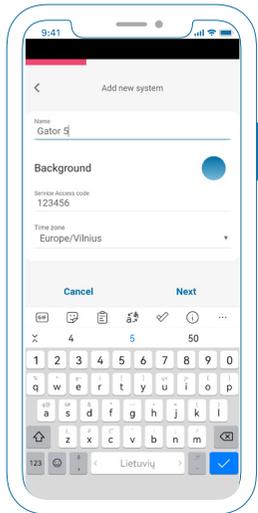

The module added for the first time must be transferred to the server closest to you. Press [Transfer](#) button.

After adding the system, a screen will open asking you to personalize your system PGMs (outputs), or you can skip this step.

6

Name your system, choose a background and change the Server Access Code if needed. The time zone is selected automatically if you have enabled the location function on your phone.

Default settings with 5 PGM (output) enabled.

Add user

The system or module can have a 1000 users. They are separated into several types.

Owner/master, admin, simple user, and unauthorized (which are only one user in all list for unauthorized access).

Owner/Master

The user type at Protegeus 2 which are the main user on The System, who can administrate, and configure. He can make scenarios, schedules, automation, and programming. The

Owner is the user who adds the system to Protegeus 2.

In some cases user list can be modified through TrikdirConfig and the admin user can be deleted, that's because users are stored on the module to work autonomously. And as a consequence the owner can't control his system. In that case go to the "[Users](#)" and you will see notification that your user isn't in the list. Push the button "[add me to the list](#)" and good to go.

Admin

In the system can be 7 admins. The admin role is to administrate other users to add or delete. It usually becomes handy for gates with huge traffic like office parking or a gated community. So the main role of the admin is for adding or removing users.

Admins can't configure system or access advanced settings.

User

Only have access to control dedicated outputs.

Unauthorized user

This user type is only one for all in the whole system. Because it is for any unauthorized access.

For example, you can give your guest the GATOR phone number and when he arrives he can make a call and the gates will open.

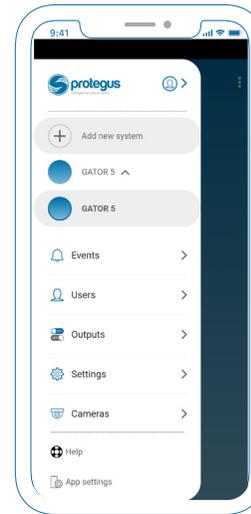

This scenario only works when you enable this user.

Add user

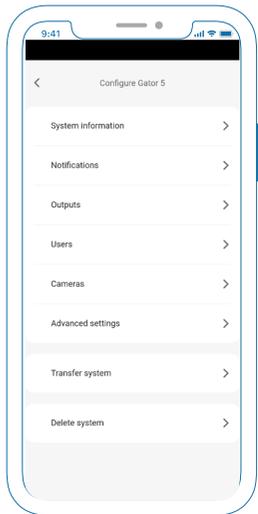

Click on the sub menu in the right corner and select [System Configuration](#).

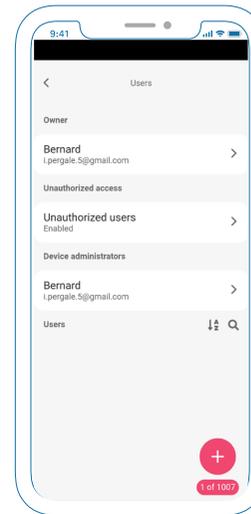

Or open side menu and select ["Users"](#).

8

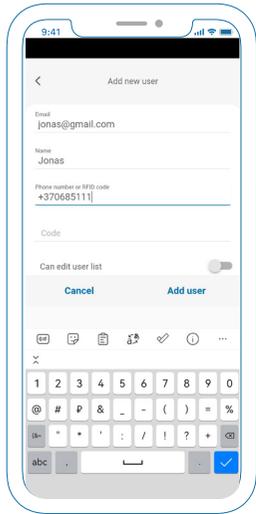

In the system configurations choose [Users](#).

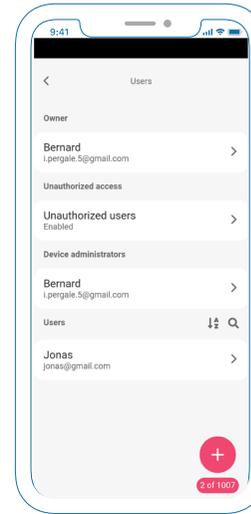

At user list press red plus button.

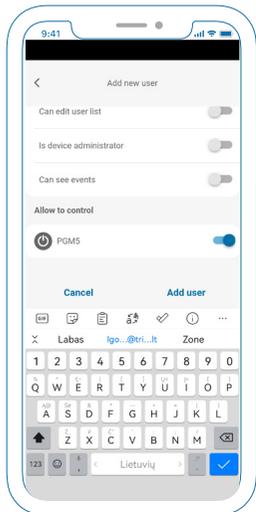

Add user

Enter user email, name and phone number.

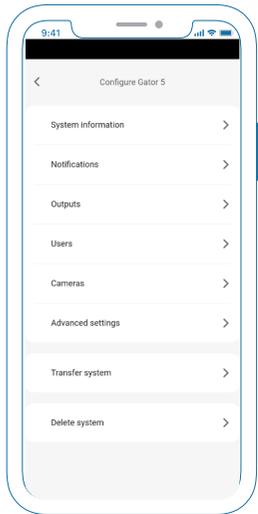

Your user should be visible on the list.

Turn on with toggle buttons the permissions you want. Assign PGM and click ["Add User"](#).

Schedule for output

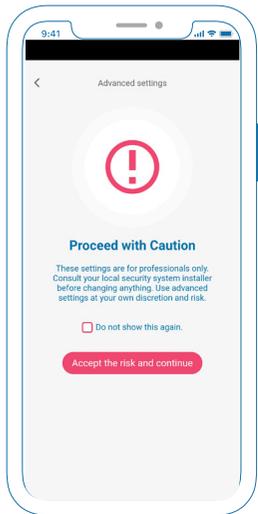

In the system configurations choose [Advanced settings](#).

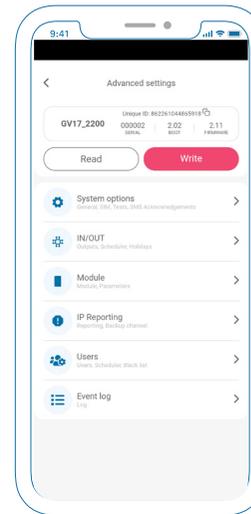

Press ["Read"](#) button to read module settings.

10

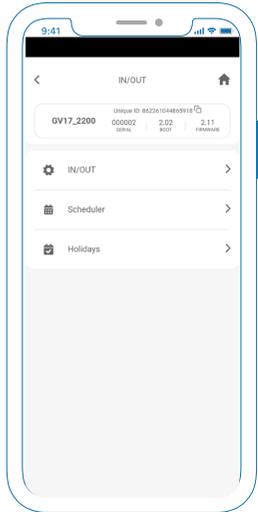

Accept disclaimer.

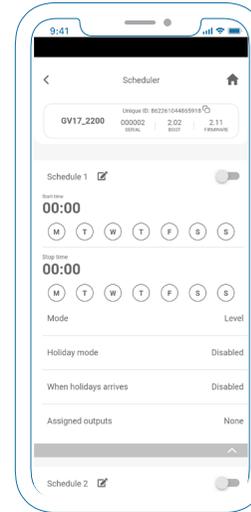

Choose [IN/OUT](#) menu item.

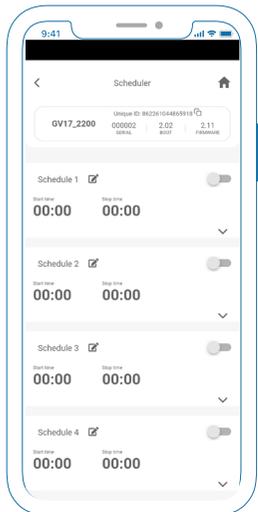

Schedule for output

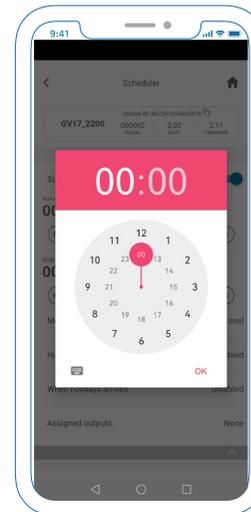

Enter "[Scheduler](#)".

Set the start time by clicking on "[Start time](#)".

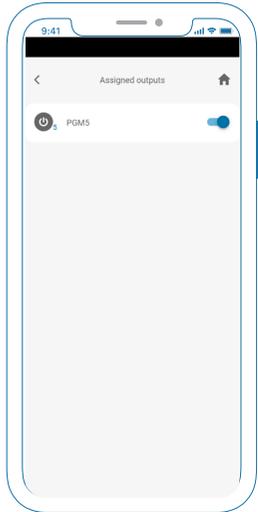

Choose one of the schedules.

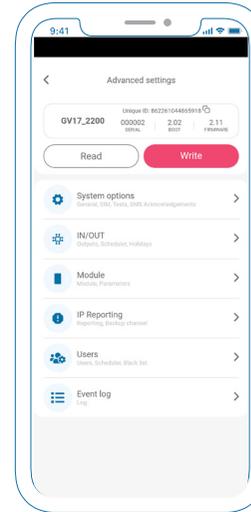

Set the time.

Schedule for output

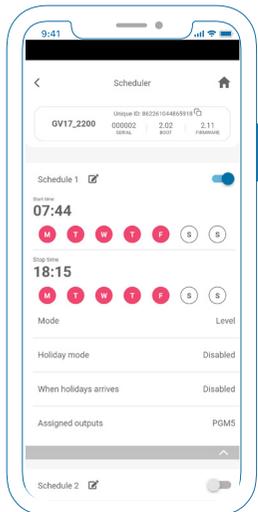

Assign PGM (Output) to schedule by pressing toggle button.

Go back to the main screen and press "Write" that the settings in the module would appear.

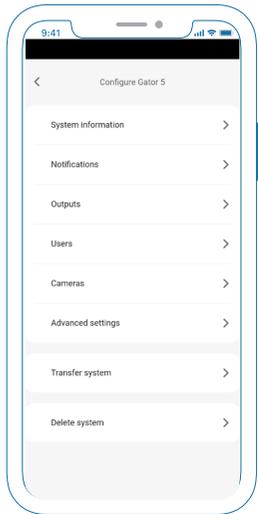

12

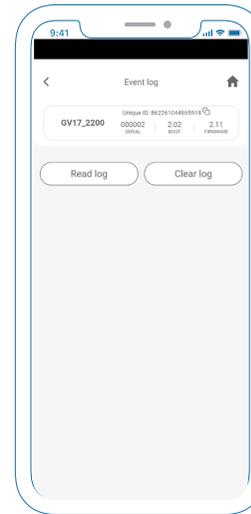

Set stop time and weeks days.

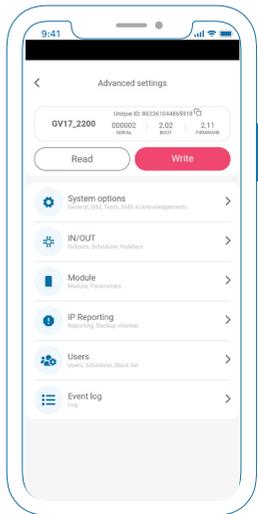

System log

Enter "[Advanced settings](#)".

At the event log screen press "[Read log](#)".

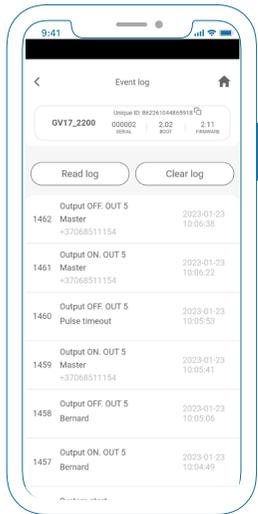

Press "[Read](#)" to read module settings and choose "[Event log](#)".

Wait for the log to be read.

System log

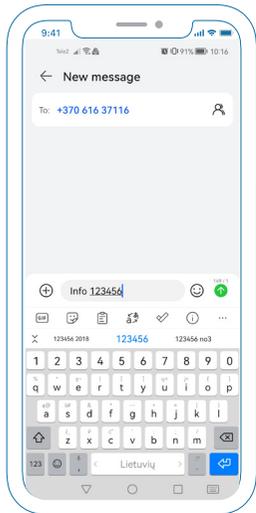

Now you can inspect system log.
